

Functional Scope Document (FSD)

Movie Ticket Booking Mobile Application:

The Movie Ticket Booking Platform is a digital solution that enables users to browse movies, book tickets online, select seats, make secure payments, and receive digital tickets. The platform consists of three interconnected interfaces that work together to manage the complete movie booking ecosystem.

Module 1: Splash Screen

When the application is launched, the splash screen is displayed with the application logo and branding elements. The system checks whether the user is already logged in.

If the user is opening the application for the first time, the onboarding screens are displayed. If the user has an active session, the application redirects directly to the Home Screen.

Module 2: Onboarding

The onboarding module introduces the key features of the application through a series of informational screens.

Users can navigate through the screens using the Next option, skip the onboarding process, or proceed using the Get Started button. Upon completion, the application redirects to the Login screen.

Module 3: Login & Sign Up

The application supports authentication using a mobile number and OTP verification.

The user enters a valid mobile number and proceeds to request an OTP. After receiving the OTP, the user enters it and completes verification. Upon successful verification, the account is authenticated and the user is redirected to the location selection screen.

New users are automatically registered during the OTP verification process, while existing users are logged into their accounts.

Module 4: Location Selection

The application requires location access to display theatres and movie shows relevant to the selected city.

Users can either allow GPS access to detect their current location automatically or manually search and select a preferred city. Once a location is selected, it is saved and the user is redirected to the Home Screen.

Module 5: Home Screen

The Home Screen serves as the main dashboard of the application.

A search bar is available at the top, allowing users to search movies by name. Recommended movies are displayed in a horizontally scrollable section showing movie posters and ratings. Latest releases are also displayed for quick access.

A bottom navigation bar is available throughout the application, providing access to:

- Home
- Movies
- Booking History
- Profile

Selecting a movie from any listing redirects the user to the Movie Details page.

Module 6: Movies

The Movies section displays all available movies currently listed on the platform.

Users can browse movies, view posters, ratings, and basic information. Selecting any movie opens the Movie Details page containing complete movie information and booking options.

Module 7: Movie Details

The Movie Details page provides comprehensive information about the selected movie.

The following information is displayed:

- Movie Title
- Duration
- Language
- Format (2D / 3D)
- Genre
- IMDb Rating
- Censor Rating
- Cast Information
- Crew Information

A "Book Tickets" button is provided to initiate the booking process.

Selecting the button redirects the user to the theatre and show selection flow.

Module 8: Movie Ticket Booking

Date Selection

Available dates for the selected movie are displayed.

The user selects a preferred date, after which available theatres and show timings for that date are loaded.

Theatre and Show Selection

A list of theatres showing the selected movie is displayed along with available timings.

Sorting options are provided to arrange theatre listings based on:

- Price
- Language
- Popularity

Selecting a theatre and show timing proceeds to seat selection.

Seat Quantity Selection

The application prompts the user to select the required number of seats before displaying the seat layout.

Once the quantity is selected, the theatre seating arrangement is displayed.

Seat Layout Selection

The theatre seat layout displays available, booked, and selected seats.

The user selects the preferred seats based on availability. The system calculates the ticket amount according to the selected seats and ticket pricing configured for that show.

After seat selection, the booking summary is displayed.

Booking Summary

A summary page displays:

- Movie Name
- Theatre Name
- Show Timing
- Selected Seats
- Ticket Charges
- Taxes and Convenience Fees
- Total Payable Amount

A payment button displaying the final amount is provided.

Example:

Pay ₹500

Selecting the payment button redirects to the payment gateway.

Module 9: Payment

The payment module supports multiple payment methods including:

- UPI
- Credit Card
- Debit Card
- Net Banking
- Wallets

Upon successful payment, the booking is confirmed and a digital ticket is generated.

If the payment fails, the user can retry the transaction. If the payment is cancelled, the application redirects back to the booking summary page.

Module 10: Ticket Generation

After successful payment, a digital movie ticket is generated automatically.

The ticket contains:

- Booking ID
- QR Code
- Movie Name
- Theatre Name
- Show Date
- Show Time
- Seat Numbers
- Amount Paid

The ticket can be viewed immediately and shared through available sharing options.

The booking is automatically saved in the Booking History section.

Module 11: Booking History

The Booking History module stores all completed and upcoming bookings.

Each booking record displays:

- Movie Name
- Theatre Name

- Date and Time
- Seat Information
- Booking Status

Selecting a booking opens the complete ticket details. Previously generated tickets can also be shared from this section.

Module 12: Profile

The Profile section provides access to account information and additional application features.

The profile information includes:

- User Name
- Mobile Number
- Profile Details

Additional options available within the Profile module include:

Support

Provides access to customer support and query management.

Offers

Displays available discounts, promotions, and campaign offers.

Gift Cards

Allows users to purchase, redeem, and manage gift cards.

Terms & Conditions

Displays the application's terms and conditions.

Privacy Policy

Displays privacy-related information and policies.

Logout

Allows users to securely sign out of the application.

Upon selecting Logout, a confirmation message is displayed. Once confirmed, the active session is terminated and the user is redirected to the Login screen.

User Flow Summary

Splash Screen

→ Onboarding

→ Login via Mobile Number & OTP

- Location Selection
- Home Screen
- Browse/Search Movies
- Movie Details
- Book Tickets
- Select Date
- Select Theatre & Show Timing
- Select Number of Seats
- Select Seats from Layout
- Review Booking Summary
- Payment
- Ticket Generation
- Booking History
- Profile
- Logout

Solve UX problems (Extra points)

1. Imagine a user wants to book movie tickets for tomorrow, but accidentally books tickets for today. After the booking is confirmed, the application currently does not allow the user to change the show date.

How would you redesign the booking experience to prevent this mistake and improve the post-booking experience?

2. A user selects two movie tickets. During seat selection, the total price displayed is ₹300 for both seats. However, when the user reaches the checkout page, the payable amount increases to ₹350 due to additional convenience fees and taxes that were not shown earlier.

Analytics show a high drop-off rate on the checkout page, with many users abandoning the booking after seeing the higher price.

How would you redesign the booking flow to improve price transparency and reduce checkout abandonment?
